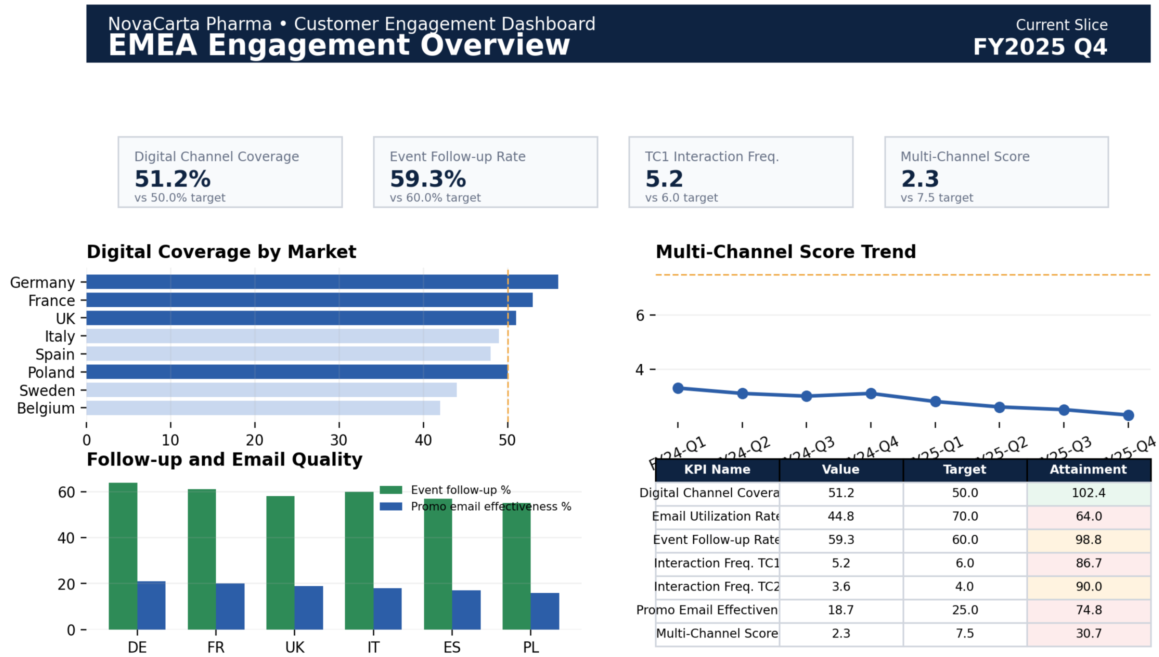
Customer Engagement Dashboard Training | Decision-Making Playbook

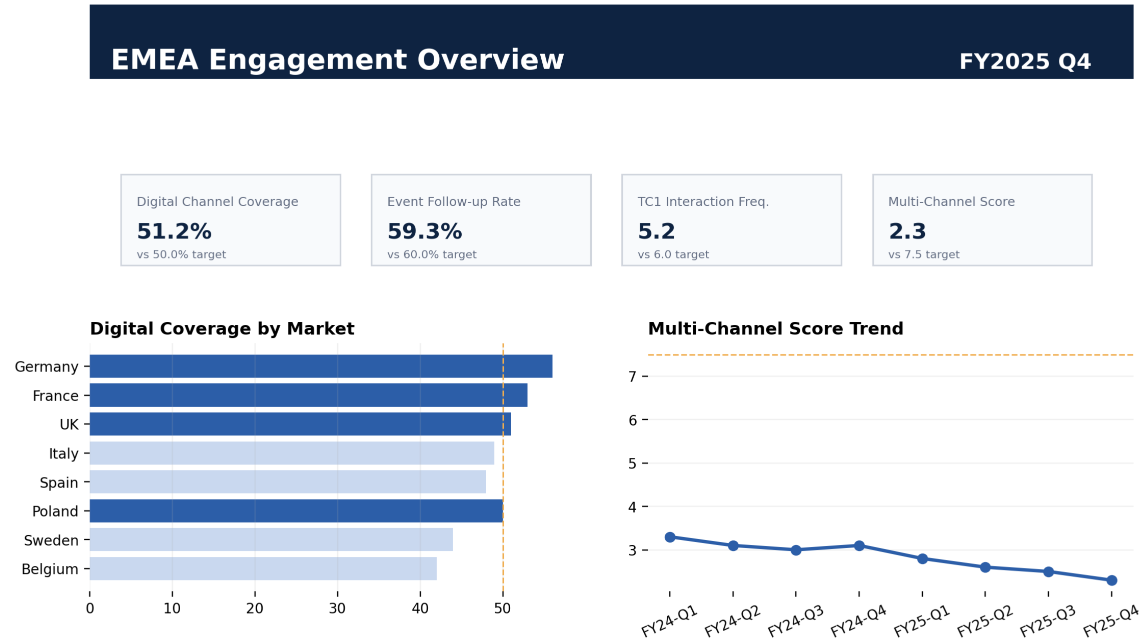
How to move from a weak engagement page to a prioritized action plan using filters, drilldowns, and KPI interpretation.



KPI Name	Value	Target	Attainment
Digital Channel Covera	51.2	50.0	102.4
Email Utilization Rate	44.8	70.0	64.0
Event Follow-up Rate	59.3	60.0	98.8
Interaction Freq. TC1	5.2	6.0	86.7
Interaction Freq. TC2	3.6	4.0	90.0
Promo Email Effectiven	18.7	25.0	74.8
Multi-Channel Score	2.3	7.5	30.7

This guide is designed for realistic end-user enablement on the Customer Engagement Dashboard in the NovaCarta EMEA dummy dataset. It follows the same training intent as the Executive Decision Playbook: help users move from a red dashboard signal to a focused, practical response. The examples are grounded in the customer-engagement KPI set, where Digital Channel Coverage can be on or near target while Event Follow-up, Promotional Email Effectiveness, Interaction Frequency, or Multi-Channel Engagement Score reveal where value is actually leaking.

1. First five clicks: a disciplined start to analysis



1. Set the fiscal quarter. 2. Read the KPI strip. 3. Check digital coverage by market. 4. Read the multi-channel score trend. 5. Open the scorecard only after the top-line engagement story is clear.

Starting with one market, one event, or one email campaign too early can lead to random hunting. Starting with the engagement cards and the top-line visuals preserves leadership discipline: first size the problem, then isolate the type of engagement weakness, then localize ownership.

2. Decision pattern: reach is healthy, but orchestration is weak

Customer Engagement KPI Scorecard | FY2025 Q4

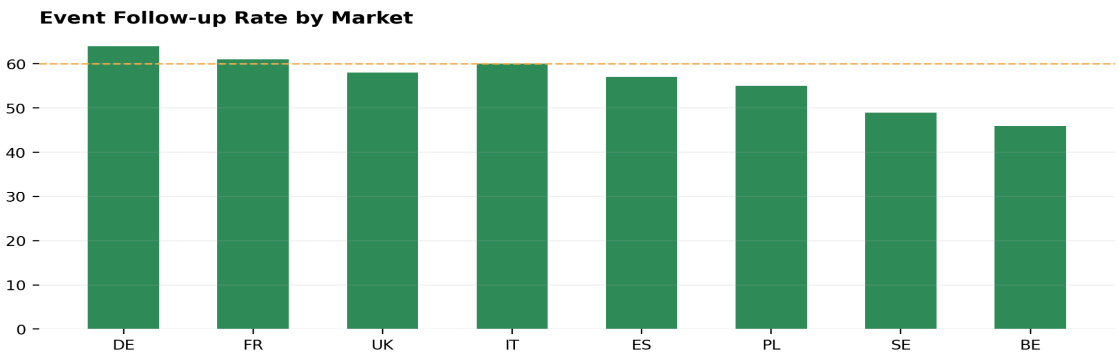
KPI Name	Value	Target	Attainment
Digital Channel Coverage	51.2	50.0	102.4
Email Utilization Rate	44.8	70.0	64.0
Event Follow-up Rate	59.3	60.0	98.8
Interaction Freq. TC1	5.2	6.0	86.7
Interaction Freq. TC2	3.6	4.0	90.0
Promo Email Effectiveness	18.7	25.0	74.8
Multi-Channel Score	2.3	7.5	30.7

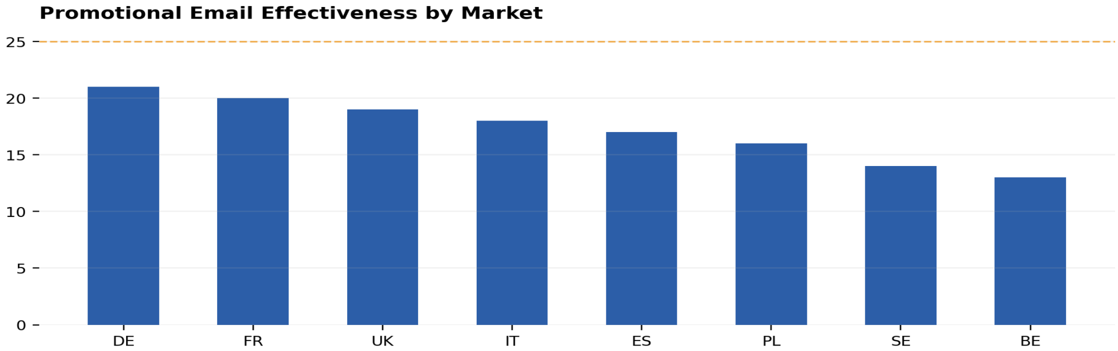
In the FY2025 Q4 slice, Digital Channel Coverage is above target at 51.2% versus a 50.0% target, but Multi-Channel Engagement Score is only 2.3 against a 7.5 target. This is the classic signal that the organization is achieving reach but not enough coordinated depth across channels.

1. Look for KPIs that are green. 2. Look for KPIs that are red but strategically important. 3. Compare one red KPI with one near-target or over-target KPI to determine whether the next action should increase activity volume or improve orchestration quality.

When reach is healthy but orchestration is weak, do not ask teams to 'just do more touches'. Improve sequencing, tighten follow-up rules, and redesign priority-account journeys so channels work together rather than as disconnected touchpoints.

3. Decision pattern: value leaks after the touchpoint



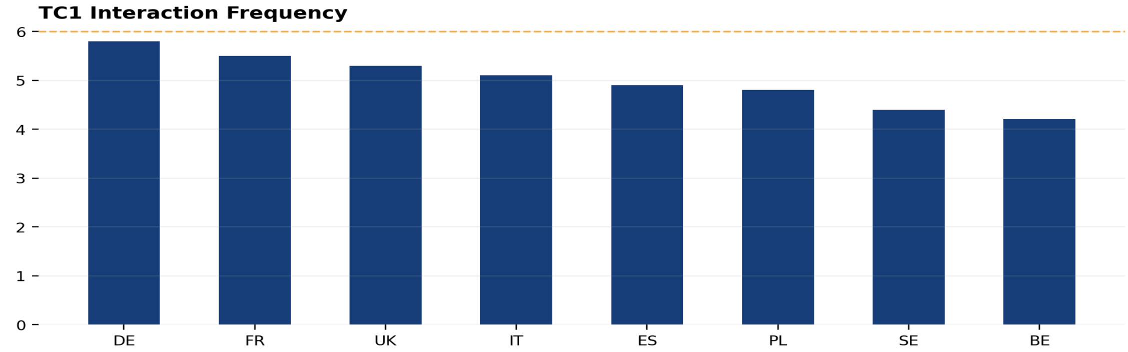


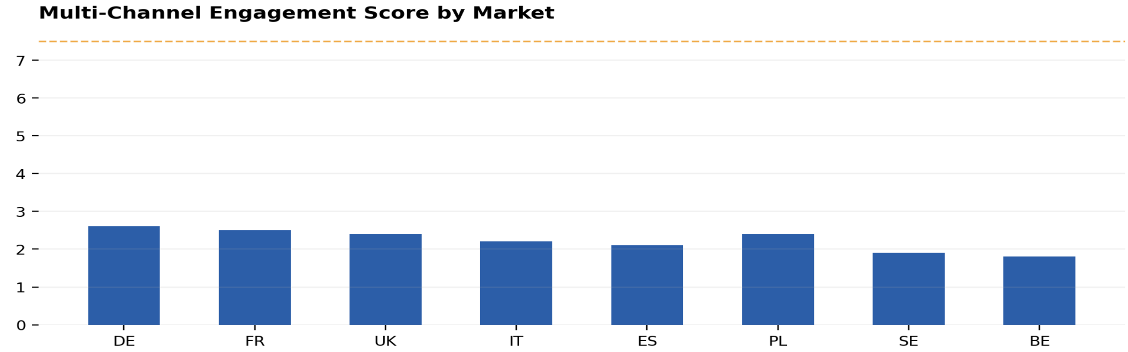
Event Follow-up Rate and Promotional Email Effectiveness are process-discipline KPIs. They reveal whether engagement is carried forward after the moment of contact. In this slice, follow-up hovers around target in the largest markets but drops materially in the lower-performing markets, while promotional email effectiveness remains below its target almost everywhere.

1. Open the event follow-up visual first and check whether low follow-up is broad-based or market-specific. 2. Compare it with promotional email effectiveness. 3. If both are weak, the problem is not only attendance or send volume; it is the quality of post-touch execution.

Treat this pattern as a value-leakage problem. The right response is tighter event-close workflows, better next-best-action rules after attendance, and stronger linkage between event activity and approved digital follow-up.

4. Decision pattern: high touch pressure, weak engagement quality



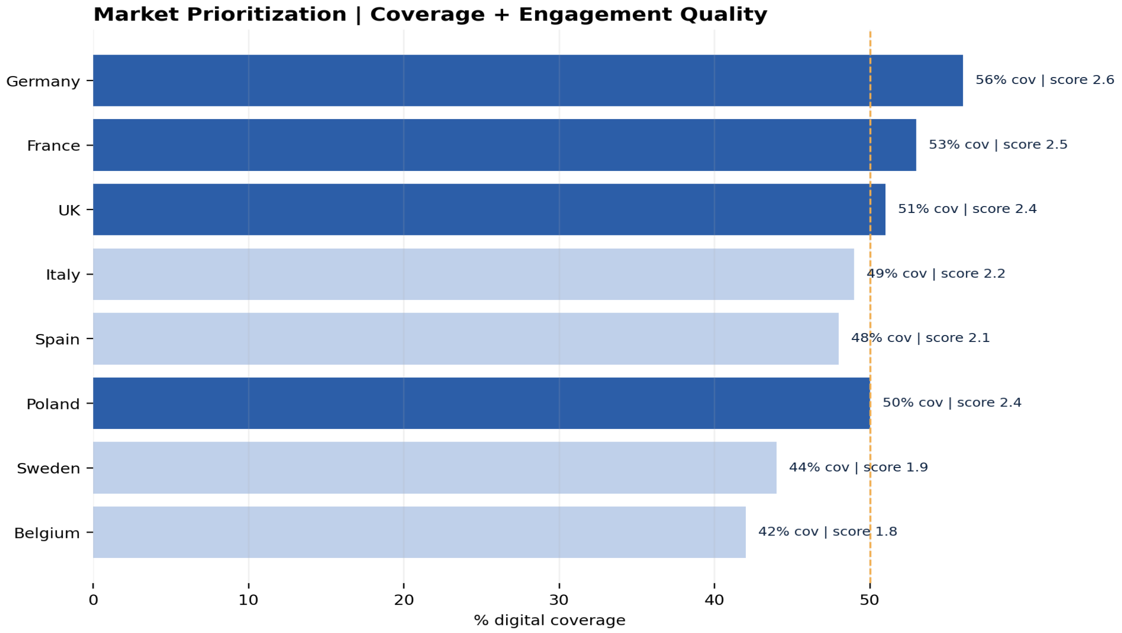


Interaction Frequency tells you whether the team is showing up often enough. Multi-Channel Engagement Score tells you whether those interactions are working together. When interaction frequency is close to plan but the multi-channel score remains weak, leadership should resist the temptation to push even more volume.

Questions to ask: Are TC1 accounts receiving repetitive touches through the same channel? Are channels sequenced intentionally, or are they simply accumulating activity? Does the follow-up flow convert one interaction into the next, or are customers experiencing isolated contacts?

Treat this pattern as an orchestration problem, not automatically as an access problem. The corrective lever is better journey design: which channel comes first, what should follow, and how quickly should the next touch happen for priority accounts.

5. Decision pattern: prioritize markets with both size and underperformance



Engagement leaders should not chase the reddest KPI alone. The correct approach is to combine market size with the type of engagement weakness. Germany and France, for example, may have acceptable digital reach but still weak orchestration scores. Smaller markets may be redder, but they do not always deserve first intervention if the commercial impact is lower.

1. Sort markets by engagement-relevant scale, such as target universe, interaction volume, or priority-account count. 2. Select the first large market with weak engagement quality. 3. Check whether the same weakness repeats across multiple major markets. 4. Escalate only after confirming that the issue is strategic, not just local noise.

> By the end of the review, the user should be able to name the top two engagement weaknesses, the top three markets to prioritize, and the two levers most likely to improve the next quarter: for example, stronger event follow-up and better multi-channel choreography.
