

Customer Engagement Dashboard Training | KPI Definitions & Calculations

The KPI logic behind the engagement cards and scorecard, with dataset-specific formulas, worked examples, and plain-language interpretation.

Document purpose

This guide is designed for realistic end-user enablement on the Customer Engagement Dashboard in the NovaCarta EMEA dummy dataset. It explains what the core engagement KPIs mean, how they are calculated, how to interpret them in human terms, and how to use them together rather than in isolation. The KPI set is grounded in the NovaCarta business and technical documentation, where Digital Channel Coverage, Email Utilization Rate, Event Follow-up Rate, Interaction Frequency TC1 and TC2, Promotional Email Effectiveness, and Multi-Channel Engagement Score are defined as the core customer-engagement measures.

1. Digital Channel Coverage

Digital Channel Coverage measures how much of the target HCP universe is reached through digital channels. In the NovaCarta framework, digital means web calls plus approved email activity. It is a breadth KPI: it answers whether digital reach exists at all, not whether the interaction was deep or compelling.

Business definition

Percentage of target universe reached via digital channels (web + email).

Digital Channel Coverage = $\text{DIVIDE}(\text{Distinct HCPs reached by WEB or APPROVED_EMAIL}, \text{Total target HCP universe})$

Worked example

If 512 target HCPs were reached digitally out of a target universe of 1,000, the result is $512 \div 1,000 = 51.2\%$. That mirrors the FY2025 Q4 reference value used in the Executive materials.

Human-friendly interpretation

This KPI answers the question: did our digital channels actually reach the people we intended to reach? A value above target is reassuring, but it should never be confused with engagement quality. A team can hit digital reach and still perform poorly on orchestration and follow-up.

2. Email Utilization Rate

Email Utilization Rate focuses on the proportion of consented HCPs who actually receive an approved email. It sits inside the digital category, but it is narrower than Digital Channel Coverage because it depends on consent status and approved-email execution.

Business definition

Percentage of consented HCPs receiving at least one approved email.

Email Utilization Rate = $\text{DIVIDE}(\text{Consented HCPs with at least one APPROVED_EMAIL interaction}, \text{Total consented HCPs})$

Worked example

If 448 consented HCPs receive at least one approved email out of 1,000 consented HCPs, the result is 44.8%. Against a 70.0% target, that means the channel is under-used even before engagement quality is assessed.

Human-friendly interpretation

This KPI tells you whether the team is using the approved-email capability enough. A low value does not automatically mean the emails are ineffective. It often means the emails are simply not being deployed widely enough among consented accounts.

3. Event Follow-up Rate and Promotional Email Effectiveness

These two KPIs are often read together because they both test whether engagement continues after an outreach moment. Event Follow-up Rate checks whether event attendance is converted into post-event action. Promotional Email Effectiveness checks whether emails generate documented engagement after delivery.

Business definitions

- Event Follow-up Rate = percentage of event attendees receiving follow-up within 14 days.
- Promotional Email Effectiveness = percentage of promotional emails with documented engagement.

Event Follow-up Rate = $\text{DIVIDE}(\text{Event attendees receiving follow-up within 14 days}, \text{Total event attendees})$
Promotional Email Effectiveness = $\text{DIVIDE}(\text{Promotional emails with documented engagement}, \text{Total promotional emails sent})$

Worked example

If 593 of 1,000 event attendees receive follow-up, the follow-up rate is 59.3%. If 187 promotional emails out of 1,000 sent show documented engagement, effectiveness is 18.7%. Both examples show a common pattern: activity exists, but value leaks after the touchpoint.

Human-friendly interpretation

These KPIs answer whether the team is closing the loop. Good events with weak follow-up waste momentum. High email sends with low effectiveness create noise rather than progression. In customer engagement reviews, these are classic process-discipline indicators.

4. Interaction Frequency and Multi-Channel Engagement Score

Interaction Frequency is the simplest intensity KPI: how often are priority accounts actually engaged? The Multi-Channel Engagement Score is the more sophisticated partner metric: how well are different touchpoints combined into a meaningful engagement pattern?

Business definitions

- Interaction Frequency TC1 = average interactions per high-potential account in the reporting period.
- Interaction Frequency TC2 = average interactions per medium-potential account in the reporting period.
- Multi-Channel Engagement Score = weighted composite score of multi-channel touchpoints per HCP.

Interaction Frequency TC1 = $\text{DIVIDE}(\text{Total TC1 interactions}, \text{Distinct TC1 accounts})$
Interaction Frequency TC2 = $\text{DIVIDE}(\text{Total TC2 interactions}, \text{Distinct TC2 accounts})$
Multi-Channel Engagement Score = Weighted composite of distinct channels, touchpoint sequence, and recency per HCP

Worked example

If 520 interactions are delivered to 100 TC1 accounts, the average interaction frequency is 5.2. If the engagement model scores each HCP across channel diversity and sequencing and the resulting average is 2.3 against a 7.5 target, the organization is touching accounts often enough to register activity but not coordinating those touches well enough to create depth.

Human-friendly interpretation

Interaction Frequency tells you whether teams are showing up. Multi-Channel Engagement Score tells you whether those interactions feel connected. A strong customer-engagement dashboard needs both, because frequency without orchestration often becomes over-contacting with limited impact.

5. Customer engagement KPI scorecard metrics

Customer Engagement KPI Scorecard | FY2025 Q4

KPI ID	KPI Name	Value	Target	Attainment
KPI006	Digital Channel Coverage	51.2	50.0	102.4
KPI007	Email Utilization Rate	44.8	70.0	64.0
KPI008	Event Follow-up Rate	59.3	60.0	98.8
KPI012	Interaction Freq. TC1	5.2	6.0	86.7
KPI013	Interaction Freq. TC2	3.6	4.0	90.0
KPI014	Promotional Email Effectiveness	18.7	25.0	74.8
KPI015	Multi-Channel Engagement Score	2.3	7.5	30.7

The customer-engagement scorecard is where the dashboard shifts from observation to diagnosis. Each KPI is read with its target so leaders can separate a simple execution shortfall from a deeper orchestration problem.

KPI Value = AVERAGE(FACT_KPI_Summary[kpi_value]) or KPI-specific aggregate from the source fact table
KPI Target = AVERAGE(FACT_KPI_Summary[target_value]) or configured target from KPI framework
KPI % Attainment = DIVIDE([KPI Value], [KPI Target])

How to read the scorecard

- Digital Channel Coverage at 102.4% attainment means reach is slightly above target.
- Event Follow-up Rate at 98.8% attainment is close to target, but still leaking value after events.
- Interaction Frequency TC1 at 86.7% attainment and TC2 at 90.0% attainment mean account pressure is present, but not fully at plan.
- Promotional Email Effectiveness at 74.8% attainment shows the team is generating less documented email engagement than needed.
- Multi-Channel Engagement Score at 30.7% attainment is the standout warning signal: channels are being used, but not orchestrated well enough to create meaningful depth.

Human-friendly interpretation

This scorecard should stop managers from asking only 'are we active enough?' It pushes them to ask the better question: 'are our touchpoints combining into a coherent customer journey?' When reach is green but orchestration is red, the correct response is not more volume. It is better sequencing, stronger follow-up, and sharper account planning.
