

Executive Dashboard Training | Features & Navigation

How to read the dashboard, what sits in each zone, where to filter, and how to drill from portfolio view to country and brand detail.

Document purpose

This guide is designed for realistic end-user enablement on the Executive Performance Dashboard in the NovaCarta EMEA dummy dataset. It explains what each area of the dashboard contains, how to filter and drill into data, how the executive KPIs are calculated, and how to turn those signals into actions.

Reference quarter used for worked examples: **FY2025 Q4**. In that slice, total revenue is **€3.70B**, target revenue is **€6.08B**, weighted market share is **19.49%**, and weighted YoY growth is **19.62%**.

1. Dashboard map: what is on the page

The executive page is a one-screen portfolio summary. It is built for BU Heads, Country Managers, and Commercial Excellence leads who need a quick read on business performance before choosing a market, brand, or quarter to investigate.

What is in the page

- The top header identifies the active reporting slice. In the mockup it is set to FY2025 Q4.
- The filter ribbon lets you limit the page by therapeutic area, brand, cluster, country, and fiscal quarter. Those slicers should be configured to cross-filter every visual on the page.
- The KPI strip shows four executive cards: Revenue, % vs Target, Market Share, and YoY Growth. These are the fastest indicators of business health.
- The left main visual is Revenue vs Target by Brand. It exposes which brands are driving the quarter and which ones are creating the variance.
- The right main visual is Market Share Trend. It tells you whether the issue is a one-quarter event or part of a longer pattern.
- The bottom row combines the KPI Scorecard and Country Performance Heat Table. Together they answer: what operational drivers are weak, and where should leadership intervene first?

2. Filters and scope selection

In Power BI the page should open with global slicers at the top. Each slicer narrows the evaluation context for all cards and charts on the page. A leadership user normally starts with fiscal quarter, then chooses a geography, then optionally narrows to one therapeutic area or one brand.

How to change the scope step by step

1. Select **Fiscal Quarter** first. The executive page is most stable when one quarter is selected, because targets are quarterly and the KPI scorecard in this dataset is stored at quarter level.
 2. Select a **Cluster** or **Country** only after confirming the quarter. This prevents confusion between time-driven changes and geography-driven changes.
 3. Select **Therapeutic Area** when you want to compare portfolio behavior within a medical franchise, for example Solid Tumors versus Neuroscience.
 4. Select a **Brand** only when you intentionally want to collapse the page to a single-product view. Once a brand is selected, the bar chart and heat table stop functioning as portfolio comparisons and become distribution views.
 5. Use the eraser icon on the slicer or the page reset button to return to the starting state after analysis.
- If multiple countries are selected, the heat table should remain sorted by revenue so the largest markets stay on top. If a brand is selected, page titles should update dynamically to avoid ambiguity.

3. KPI strip: how leadership reads the top row

The KPI strip is the triage layer. Leadership should be able to decide within seconds whether the quarter is on plan, growing, or under pressure. In the FY2025 Q4 slice, the page shows Revenue of €3.70B, achievement of 60.8% to target, weighted market share of 19.49%, and weighted YoY growth of 19.62%.

KPI Strip

Revenue €3.70B FY2025 Q4 actual	% vs Target 60.8% vs €6.08B target	Market Share 19.5% weighted by revenue	YoY Growth +19.6% weighted by revenue
--	---	---	--

How to use the cards

- Start with **% vs Target**. At 60.8%, the page immediately tells you the quarter is materially under plan.
- Use **Revenue** to size the problem. A 39.2% shortfall against a €6.08B target is a gap of €2.38B.
- Use **Market Share** and **YoY Growth** together. In this dummy slice, share remains close to 19.5% while YoY growth is almost 19.6%. That means the business is still growing versus last year, even though it is behind an aggressive plan.
- After reading the cards, go straight to brand contribution. Cards diagnose *that* a problem exists; the brand chart explains *where* it comes from.

Cards themselves usually do not support drill-down. Instead, the user clicks a bar in the brand chart or a country row in the heat table.

4. Main analysis visuals: brand contribution and market trajectory

The central work of the executive page happens in the two large visuals. The left chart identifies the portfolio components behind the variance. The right chart places the quarter in trend context.

How to use the bar chart

Read the bar chart from top to bottom. The first question is not “which brand is biggest?” but “which brand contributes most to the target gap?” In FY2025 Q4, LUNARA contributes the largest absolute revenue but is only at 47.5% of target, creating the largest variance.

How to use the trend chart

The market share chart tells you whether the under-performance is accompanied by structural share loss. In this slice, weighted market share remains in a narrow band around 19.5% across twelve quarters.

1. Click a bar for one brand. The trend line should immediately recalculate for that selected brand only.
2. Right-click and choose drillthrough to a Brand Detail page when you need more decomposition.
3. Ctrl-click multiple bars when you want to compare a priority set.

5. Scorecard, heat table, and drill path

The bottom row converts the headline performance story into action. The KPI scorecard highlights which operational signals are lagging. The country heat table localizes where the performance problem is most material.

Executive KPI Scorecard | FY2025 Q4

	KPI Name	Value	Target	Attainment
KPI001	Field Day %	45.2	75.0	60%
KPI002	Target Coverage Rate	77.9	80.0	97%
KPI006	Digital Channel Coverage	51.2	50.0	102%
KPI008	Event Follow-up Rate	59.3	60.0	99%
KPI012	Interaction Frequency TC1	5.2	6.0	87%
KPI015	Multi-Channel Engagemer	2.3	7.5	31%

Country Performance Heat Table | FY2025 Q4

Reading the scorecard

Use the scorecard to distinguish between a demand problem and an execution problem. In the FY2025 Q4 example, Digital Channel Coverage is slightly above target, while Multi-Channel Engagement Score is only 30.6% of target. That means reach exists, but the quality and orchestration of engagement are weak.

Reading the heat table

The heat table shows that large markets such as Germany, France, the United Kingdom, Italy, and Spain all sit around 60% to target. Because these are also the largest revenue contributors, they should be addressed before small-market noise is investigated.

Start in the heat table by selecting one underperforming country, for example Germany. Then review the brand bars under the Germany filter. Next, drill to the country page or brand page and inspect whether the issue is concentrated in one franchise, one brand, or one execution KPI.
