

Field Force Dashboard Training | Features & Navigation

How to read the dashboard, what sits in each zone, where to filter, and how to drill from regional view to country, territory, and rep detail.

Document purpose

This guide is designed for realistic end-user enablement on the Field Force Performance Dashboard in the NovaCarta EMEA dummy dataset. It explains what each area of the dashboard contains, how to filter and drill into data, how the operational KPIs should be interpreted, and how managers should move from a page-level signal to a coaching or execution conversation. Reference quarter used for worked examples: FY2025 Q4. In that slice, Field Day % is 45.2%, Call Plan Adherence is 80.9%, Interactions / Day is 2.43, and Coaching Days are 3.29.

1. Dashboard map: what is on the page

The field force page is a one-screen execution summary. It is built for Country Managers, Sales Directors, and Commercial Excellence leads who need a quick read on field productivity before choosing a geography, brand, or representative to investigate.

What is in the page

- The top header identifies the active reporting slice. In the mockup it is set to FY2025 Q4.
- The filter ribbon in Power BI should let the user limit the page by fiscal year, quarter, cluster, country, and brand. Those slicers should cross-filter every visual on the page.
- The KPI strip shows four field-management cards: Field Day %, Call Plan Adherence, Interactions / Day, and Coaching Days. These are the fastest indicators of field health.
- The left main visual is Top vs Bottom Reps. It exposes where interaction volume is concentrated and which individuals fall into the bottom tier.
- The right main visual is Calls vs Adherence. It tells you whether the volume story is also a discipline story.
- The bottom row combines the Interaction Trend and Country Drilldown. Together they answer: is the issue getting better or worse over time, and where should management intervene first?

2. Filters and scope selection

In Power BI the field page should open with global slicers at the top. Each slicer narrows the evaluation context for all cards and charts. A field leader normally starts with fiscal quarter, then chooses a geography, then optionally narrows to one brand to separate franchise effects from general execution issues.

How to change the scope step by step

1. Select Fiscal Quarter first. The field page is most stable when one quarter is selected, because performance KPIs such as adherence and coaching are reviewed in quarter context.
2. Select a Cluster or Country only after confirming the quarter. This prevents confusion between time-driven changes and geography-driven differences.
3. Select Brand when you want to isolate whether the execution issue is specific to one product focus. Once a brand is selected, rep ranking and trend stop behaving like cross-portfolio comparisons and become brand-specific execution views.
4. If you need to compare countries, clear the old country selection before applying the next one. This avoids accidental multi-select context.
5. Use the eraser icon on the slicer or the page reset button to return to the starting state after analysis.

If multiple countries are selected, the ranking chart should remain sorted by interactions so the highest-volume reps stay visible. If one brand is selected, page titles should update dynamically to avoid ambiguity.

3. KPI strip: how field leadership reads the top row

The KPI strip is the triage layer for the field page. A manager should be able to decide within seconds whether the selected team has enough customer-facing capacity, enough planning discipline, and enough coaching support to deliver the quarter.

How to use the cards

- Start with **Call Plan Adherence**. At 80.9% versus an 85.0% target, the page immediately signals that execution discipline is below expected level.
- Use **Field Day %** to test capacity. At 45.2% versus a 75.0% target, the selected population is spending much less time in the field than the operating model expects.
- Use **Interactions / Day** to understand productivity inside available field time. A low number means even the field days that do happen are not converting into enough engagement.
- Use **Coaching Days** to judge whether manager support is likely to be part of the story. A moderate average such as 3.29 days per manager per month suggests some support exists, but not necessarily enough to offset weak execution.

Cards themselves usually do not support drilldown. Instead, the user clicks a rep bar in the ranking chart, a point in the scatter plot, or a country in the drilldown chart to move from diagnosis to investigation.

4. Main analysis visuals: rep contribution, efficiency, and execution rhythm

The central work of the field page happens in three visuals. The ranking chart identifies where volume sits. The scatter plot places that volume in a quality context. The time trend tells you whether the issue is temporary or persistent.

How to use the rep ranking

Read the chart from top to bottom. The first question is not simply which rep is highest, but whether the lower tier is concentrated in one market, manager line, or brand focus. In the FY2025 Q4 mockup, the bottom tier includes Jonas Berg, Claire Martin, and Tomas Horvat, which should trigger a territory or country check.

How to use the scatter plot

The scatter plot is the best coaching visual on the page. Top right means high volume with good discipline. Bottom left is the classic coaching priority zone. Lower-right positions suggest reps are active but not converting plan into disciplined execution. Upper-left positions suggest planning is acceptable, but customer access or capacity may be limiting.

5. Trend, country drilldown, and drill path

The lower row converts the execution story into action. The trend chart shows whether the quarter is building enough activity over time. The country drilldown localizes where performance problems matter most. Together they answer: is the issue getting worse, and where should leadership intervene first?

Reading the trend chart

Use the trend to distinguish between one-off disruption and structural under-execution. In the mockup, actual interactions remain consistently below the target line through all twelve months. That means the issue is not a single-month anomaly; it is a recurring performance gap.

Reading the country drilldown and following the drill path

The country view shows where the performance problem is most material. Large markets such as Germany, France, Italy, and Spain combine meaningful interaction volume with mixed adherence outcomes, so they should be reviewed before smaller-market noise.

Start in the country chart by selecting one underperforming market, for example Sweden or Croatia if the question is discipline, or Germany if the question is scale of missed execution. Then review the rep ranking under that country filter. Next, click a rep or drill to territory. Finally, open the rep drill table to inspect Field %, Adherence %, and IPD side by side before deciding on coaching, route redesign, or call-planning intervention.

Rep Drilldown Table

Rep	CTY	Field %	Adherence %	IPD
Anna S.	DE	81.8	91.2	4.61
Sophie D.	FR	77.3	88.8	4.65
Luca R.	IT	77.3	86.0	4.35
Eva N.	PL	72.7	82.1	4.31
Marta S.	ES	68.2	79.0	4.27
Marco K.	NL	72.7	74.4	3.81
Jonas B.	SE	54.5	66.1	3.25
Claire M.	BE	50.0	63.2	3.27

A strong field manager does not stop at the first red signal. They use the dashboard to narrow the problem from geography to territory to rep, and only then decide on corrective action.
