

Field Force Dashboard Training | KPI Definitions & Calculations

The KPI logic behind the field-force cards and scorecard, with dataset-specific formulas, worked examples, and plain-language interpretation.

Document purpose

This guide is designed for realistic end-user enablement on the Field Force Performance Dashboard in the NovaCarta EMEA dummy dataset. It explains what the key execution KPIs mean, how they are calculated, how to interpret them in human terms, and how to use them together rather than in isolation. Reference quarter used for worked examples: FY2025 Q4. In that slice, Field Day % is 45.2%, Call Plan Adherence is 80.9%, Interactions / Day is 2.43, and Coaching Days are 3.29.

1. Field Day %

Field Day % measures how much of the available month is actually spent in the field rather than in internal meetings, administration, travel preparation, or training. It is the cleanest top-line proxy for customer-facing capacity.

Business definition

Percentage of total working days spent on field-based customer engagement activity.

Field Day % = $\text{DIVIDE}(\text{SUM}(\text{FACT_Performance}[\text{field_days}]), \text{SUM}(\text{FACT_Performance}[\text{total_working_days}])))$

Worked example

If the selected team logged 10 field days out of 22 total working days, the calculation is $10 \div 22 = 45.5\%$. That aligns with the dashboard-style reference value of 45.2% in the FY2025 Q4 slice.

Human-friendly interpretation

A low value does not automatically mean reps are underperforming. It usually means the team has limited customer-facing capacity. The next question is therefore: is time being absorbed by internal work, or is field time available but poorly used?

2. Call Plan Adherence

Call Plan Adherence shows how reliably the team converts planned customer activity into completed calls. It is a discipline KPI rather than a pure productivity KPI.

Business definition

Percentage of planned calls that were actually completed during the selected period.

```
Call Plan Adherence = DIVIDE(SUM(FACT_Performance[actual_calls]),  
SUM(FACT_Performance[planned_calls]))
```

Worked example

If a rep completed 58 calls against a plan of 76, the result is $58 \div 76 = 76.3\%$. If the selected team has strong performers and weak performers mixed together, the dashboard aggregate may still land at 80.9%, which is below the 85.0% target but not in collapse territory.

Human-friendly interpretation

Think of adherence as a promise-kept metric. The plan says what the team intended to do; adherence shows whether they actually did it. Low adherence is often the first sign that execution discipline, scheduling quality, or account access is under strain.

3. Interactions per Day

Interactions per Day converts raw activity into productivity. It prevents managers from praising a team just because it spent many days in the field if those days produced little engagement.

Business definition

Average completed interactions delivered for each field day in the selected period.

```
Interactions / Day = DIVIDE(SUM(FACT_Performance[interaction_count]),  
SUM(FACT_Performance[field_days]))
```

Worked example

If a rep completed 31 interactions across 10 field days, the result is $31 \div 10 = 3.10$. If the selected FY2025 Q4 dashboard slice shows 2.43, it means the team is converting field time into customer contact more slowly than the benchmark of 3.5 interactions per day.

Human-friendly interpretation

This KPI answers a simple question: when reps are out in the field, are those days productive? A low value can point to poor route planning, weak call productivity, or too much dead time between appointments.

4. Coaching Days

Coaching Days quantify how much manager attention is being invested in capability-building. It is not a commercial outcome by itself, but it is one of the best context variables for explaining why adherence or productivity is improving or stagnating.

Business definition

Average days per manager per month spent in formal coaching, ride-alongs, or structured rep development activity.

```
Coaching Days = AVERAGE(FACT_Performance[kpi009_coaching_days])
```

Worked example

If six managers show 4.1, 3.9, 3.6, 3.3, 2.8, and 2.3 coaching days, the average is 3.33. That is close to the dashboard-style reference of 3.29 days per manager per month.

Human-friendly interpretation

Low coaching with weak adherence is a warning signal. High coaching with weak adherence suggests the support exists but may not be effective. High coaching with improving adherence is usually a healthy recovery pattern.

5. Field KPI scorecard metrics

Field KPI Scorecard | FY2025 Q4

KPI ID	KPI Name	Value	Target	Attainment
KPI001	Field Day %	45.2	75.0	60.3
KPI003	Call Plan Adherence	80.9	85.0	95.2
KPI004	Interactions / Day	2.43	3.5	69.4
KPI009	Coaching Days	3.29	4.0	82.2
KPI002	Target Coverage Rate	77.9	80.0	97.4
KPI011	Leading Specialist Coverage	83.6	85.0	98.4

The field scorecard is where the dashboard stops being a collection of numbers and starts behaving like a management tool. It compares KPI values with targets so leaders can distinguish between an isolated weak metric and a broader execution pattern.

```
KPI Value = AVERAGE(FACT_KPI_Summary[kpi_value])
KPI Target = AVERAGE(FACT_KPI_Summary[target_value])
KPI % Attainment = DIVIDE([KPI Value], [KPI Target])
```

How to read the scorecard

- Field Day % at 60.3% attainment signals constrained customer-facing capacity.
- Call Plan Adherence at 95.2% attainment is below target but still recoverable through planning discipline.
- Interactions / Day at 69.4% attainment says field time is not productive enough.
- Coaching Days at 82.3% attainment suggests development effort exists, but not yet at target level.
- Coverage KPIs such as Target Coverage Rate and Leading Specialist Coverage help show whether weak execution is also limiting reach.

Human-friendly interpretation

The scorecard is the dashboard's reality check. One low KPI might be noise. Several weak KPIs pointing in the same direction usually mean the operating model needs intervention. Use the scorecard to decide whether the conversation should focus on capacity, discipline, productivity, or manager support.
